

1.6 – Call it with MCP Inspector

Student: Sereen Karakra

Academy: NextFlows Academy

Week: 1 – What is MCP?

Section: 1.6 – Call it with MCP Inspector

Repository: <https://github.com/Sereen-Karakra/my-first-mcp>

Objective

Verify that the first MCP server works correctly by connecting it to MCP Inspector, listing the available tool, and testing both valid and invalid inputs

What I Completed

- Launched MCP Inspector using:
`npx @modelcontextprotocol/inspector npx tsx src/index.ts`
- Successfully connected the Inspector to my MCP server.
- Confirmed that the **greet** tool appeared in the **Tools** tab.
- Verified the tool description and input schema.
- Successfully called the tool with valid input and received the expected greeting response.
- Tested invalid input by leaving the required field empty and confirmed that Zod rejected the request with an input validation error before the tool executed.

Result

The MCP server connected successfully to MCP Inspector. The **greet** tool was detected correctly, executed successfully with valid input, and invalid requests were rejected through Zod validation as expected.

Evidence

Figure 1: MCP Inspector connected to the server and successful execution of the **greet** tool.

Figure 2: Zod validation rejecting an invalid request with an empty required field.

Conclusion

The first MCP server was successfully tested using MCP Inspector. The tool was discovered correctly, executed with valid input, and invalid input was rejected through schema validation, confirming that the server behaves as expected.
